Senior software engineer with 10+ years shipping, debugging, refactoring and reviewing production code across Python 3, TypeScript, JavaScript/React, PHP/Laravel and C++. Sole architect of two live platforms from zero — including an escrow-backed exchange with event-driven, high-concurrency settlement where a single defect moves real money. I own hard defects end to end, defend technical decisions in writing, and hold code to a reviewable standard. I build daily with AI tools (Claude, Codex) and know precisely where models break on real engineering problems — and how to ship the expert-level fix.

10+

Years shipping production code

Platforms architected solo, zero→live

## EXPERIENCE

### Co-Founder & CTO / Lily Africa Technologies 2020 – NOW

- Architected an escrow-backed, multi-asset P2P exchange solo: an event-driven, queue-based settlement engine with REST APIs serving React web and React Native clients, on a high-concurrency MySQL layer where a single defect costs users money.
- Set the engineering bar for the early team — code-review standards, documented decisions, and PHPUnit/Jest coverage on transaction-critical paths.

### Founder & Solo Engineer / Time & Chance · tncmarkets.com 2023 – NOW

- Designed and shipped a real-time prediction-markets platform end to end — TypeScript/React front end, REST API back end, live pricing and automated settlement — owning every layer from data model to UI.

### Full-Stack Engineer / Codingal · Immersive Capital 2021 – 2022

- Isolated and resolved security vulnerabilities and slow-query bottlenecks across an international education platform; refactored legacy modules while shipping reviewed, documented code in a distributed, multi-timezone team.

### Founder & Lead Engineer / Classes.ng 2019 – NOW

- Built an education marketplace solo (PHP/MySQL) with programmatic page generation at scale; optimised the read path and data architecture to 30,000+ monthly users on minimal infrastructure. Winner, NYIF 2020.

### Earlier

**Software Engineer**, Origin Tech Group (2019–20) — booking / dispatch / payments back end · **Frontend Engineer**, DIYBlockchain, Mountain View (2018–19) — React/Angular API tooling · **CTO**, Invercer (2016–18) · Unity3D / C++ game development — built Nigeria's first 3D Android game (2013).

## SELECTED SYSTEMS

LILY.AFRICA

Escrow settlement engine

Event-driven queues · REST · React / RN · high-concurrency SQL

TIME & CHANCE

Real-time markets, built solo

TypeScript · React · live pricing · automated settlement

CATCH THE THIEF

Nigeria's first 3D Android game

Unity3D · 3D math · game loop & physics

## CORE STRENGTHS

- Debugging & Optimisation**  
Complex defect isolation · performance bottlenecks · slow-query & memory profiling · security fixes
- Refactoring**  
Legacy modernisation · large-codebase restructuring · SOLID & design patterns
- Algorithms & Data**  
Data structures · high-concurrency design · queue / event-driven systems · SQL optimisation
- Review & Docs**  
Code review · technical writing · documented reasoning · PHPUnit / Pest / Jest
- AI-Assisted Dev**  
Claude / Claude Code · Codex · AI-in-the-loop review & refactoring

## LANGUAGES

Python 3

TypeScript

JavaScript / React

PHP / Laravel

C++

## STACK

REST APIs

Event-driven queues

React Native

MySQL

PHPUnit

Pest

Jest

Unity3D

Git

## EDUCATION

**B.Sc. Computer Engineering**  
University of Lagos · 2010–2018  
**Winner** — NYIF 2020 EduTech Challenge (1 of 12 national winners)
